Telestream Live Capture: Recording

This guide describes how to start and stop recording using the Telestream Lightspeed Live Capture ingest servers.

Background Info

The TV studio cameras send their signal into a device called an **ingest server**. The ingest server records the camera signal as a ProRes file, and then pushes that file up to cloud storage for students to access. The ingest server is operated through the **Live Capture** interface in a web browser.

Starting Recording

To begin recording:

1. Verify that all sources in the Live Capture interface are receiving a signal and display their **Current State** as *Ready*.
